# Connecting Across Borders and Closing Gaps

## BeyondHIE embodies a boundaryless, patient-centric approach to data

We are dedicated to increasing secure and appropriate access to data to better support cross-border interoperability and existing use cases that Health Information Networks (HINs) and Health Information Technology (HIT) developers have enabled for their populations. Value-based care and improved patient outcomes cannot become a reality if health data is constrained to a siloed geography.

BeyondHIE supports core sets of data that will be available among networks connected through the Common Agreement for the following exchange purposes: treatment, individual access services, public health, benefits determination, a subset of the HIPAA-defined payment activities (utilization review), and a subset of the HIPAA-defined healthcare operations (quality assessment and improvement, business planning, and development).

## One Connection to Improve Efficiency

Decrease costs and improve efficiency by reducing or eliminating the need to join multiple HINs, reducing the need for multiple legal agreements, or creating one-off, point-to-point interfaces. BeyondHIE can also provide HIT developers and HINs with a common set of privacy and security requirements for the purpose of protecting patient data, including requirements on identity proofing and authentication.

## Connecting Geographies and Closing Gaps for:

- Advanced Care Planning
- Direct Messaging
- Provider Directory
- Community Health Record
- Whole person data
- Boundaryless patient centric approach to data management
- Consent Management
- Connection to Prescription Drug Monitoring Programs
- Prescription Status and Medication Fill History
- Affordable, interface development across multiple platforms

*Industry leaders have come together to create BeyondHIE.*

*We offer valuable, timely, and actionable information, delivered where, when, and how it's needed to assure optimal care and health.*
